1. Which of the following is most often associated with the elaborate courtship rituals conducted by many birds?
   a. species recognition  
   b. Migration  
   c. feeding response  
   d. altruism  
   e. kin selection

2. The differences in cricket calls among sympatric species of crickets are examples of
   a. habitat isolation  
   b. temporal isolation  
   c. physiological isolation  
   d. behavioral isolation  
   e. geographic isolation

3. Which of the following statements best expresses the concept of punctuated equilibrium?
   a. Small variations gradually accumulate in evolving lineages over periods of millions of years.
   b. Random mating ensures that the proportions of genotypes in a population remain unchanged from generation to generation.
   c. Stability is achieved when selection favors the heterozygote, while both types of homozygotes are at a relative disadvantage.
   d. Evolutionary changes consist of rapid bursts of speciation alternating with long periods in which species remain essentially unmodified.
   e. Under competition for identical resources, one of the two competing species will be eliminated or excluded

4. Which of the following principles is NOT part of Darwin’s theory of evolution by natural selection?
   a. Evolution is a gradual process that occurs over long periods of time.
   b. Variation occurs among individuals in a population.
   c. Mutations are the ultimate source of genetic variation.
   d. More individuals are born than will survive.
   e. Individuals that possess the most favorable variations have the best chance of reproducing.

5. In a small group of people living in a remote area, there is a high incidence of “blue skin”, a condition that results from a variation in the structure of hemoglobin. All of the “blue-skinned” residents can trace their ancestry to one couple, who were among the original settlers of this region. The unusually high frequency of “blue skin” in the area is an example of
   a. mutation  
   b. genetic drift  
   c. natural selection  
   d. sexual selection  
   e. heterozygote advantage
6. In certain Native American groups, albinism due to a homozygous recessive condition in the biochemical pathway for melanin is sometimes seen. If the frequency of the allele for this condition is 0.06, which of the following is closest to the frequency of the dominant allele in this population? (Assume Hardy-Weinberg equilibrium.)
   a. 0.04  
   b. 0.06  
   c. 0.1  
   d. 0.36  
   e. 0.94

Question 7-8. In a certain flock of sheep, 4 percent of the population has black wool and 96 percent has white wool. Assume Hardy-Weinberg equilibrium.

7. If black wool is a recessive trait, what percentage of the population is heterozygous for this trait?
   a. 4%  
   b. 20%  
   c. 32%  
   d. 64%  
   e. 80%

8. What percentage of the population is homozygous for white wool?
   a. 20%  
   b. 40%  
   c. 64%  
   d. 80%  
   e. 96%

Sample Free Response Questions

FRQ A
1. 2004:2 Darwin is considered the "father of evolutionary biology." Four of his contributions to the field of evolutionary biology are listed below.
   a. The nonconstancy of species  
   b. Branching evolution, which implies the common descent of all species  
   c. Occurrence of gradual changes in species  
   d. Natural selection as the mechanism for evolution

For EACH of the four contributions listed above, discuss one example of supporting evidence.

2. Darwin's ideas have been enhanced and modified as new knowledge and technologies have become available. Discuss how TWO of the following have modified biologists' interpretation of Darwin's original contributions.
   a. Hardy-Weinberg equilibrium  
   b. Punctuated equilibrium  
   c. Genetic engineering
FRQ B
1. Biologists are interested in preserving the diversity of living organisms on the planet.
   a. Explain THREE of the following processes of phenomena, using an appropriate example for each.
      i. Mutation
      ii. Adaptive radiation
      iii. Polyploidy
      iv. Population bottlenecks
      v. Growth of the human population
   b. For each process or phenomenon you selected in (a), discuss its impact on the diversity of life on Earth.

FRQ C
1. Charles Darwin proposed that evolution by natural selection was the basis for the differences that he saw in similar organisms as he traveled and collected specimens in South America and on the Galapagos Islands.
   a. Explain the theory of evolution by natural selection as presented by Darwin.
   b. Each of the following relates to an aspect of evolution by natural selection. Explain three of the following.
      i. Convergent evolution and the similarities among species (ecological equivalents) in a particular biome (e.g., tundra, taiga, etc.)
      ii. Natural selection and the formation of insecticide-resistant insects or antibiotic-resistant bacteria
      iii. Speciation and isolation
      iv. Natural selection and behavior such as kinesis, fixed-action-pattern, dominance hierarchy, etc.
      v. Natural selection and heterozygote advantage
